

MOUSETRAP INSTALLATION GUIDE

In the class on Friday, we'll start to play around with mouse tracking. We'll do that in a program called OpenSesame with an add-on called MouseTrap. If you're interested, the GitHub behind MouseTrap can be found here: <https://github.com/PascalKieslich/mousetrap-os>

Please install the program and the add-on before Friday using the following instructions, so we are ready to go when you get to class :-)

Installing OpenSesame

- Download the OpenSesame software from the following link choosing the software compatible with your computer (choose mac if you're mac, windows if you're windows) and follow the instructions: <https://osdoc.cogsci.nl/3.2/download>.

For Mac people: When you've installed OpenSesame, your computer might refuse to open it. You can force the program to open by right clicking and then choose 'open' instead of double-clicking as you normally would. If this doesn't cut it, you'll have to go into the system settings and allow the program to open.

Adding MouseTrap to OpenSesame

- Open OpenSesame and copy-paste the following into the console:

```
!pip install https://github.com/PascalKieslich/mousetrap-os/archive/master.zip
```

If the output of the console doesn't say anything troubling, close and reopen OpenSesame. When expanding the tools list (arrow in the bottom left corner) you should see two MouseTrap icons in pink and orange. If they are there, you're good to go. If not, see the trouble shooting section below.

In case you've been looking at the mouse trap repository, this installs the newest development version of MouseTrap (and not the newest stable version). This is necessary because OpenSesame has been updated in the meantime.

Quick troubleshooting for the Mac people:

If the above command didn't work, copy-paste the following into the console in OpenSesame:

```
import pip._internal
```

And then

```
pip._internal.main(['install', 'https://github.com/PascalKieslich/mousetrap-os/archive/master.zip'])
```

Quick troubleshooting for Windows people:

If the output of the console says something about 'access denied', try to close OpenSesame and then reopen it by right clicking the program and then choose 'run as administrator'. Then type the same command in the console as before.
